Asset Inspection System

- Add and manage Assets on site
- Manage inspection routine for each asset
- Record inspection details onto the system
- Instant email alerts for missed inspections
- Bespoke reports
- QR Code Reader

No matter what asset inspection routine you follow, DataScope can streamline the process, saving valuable time and ensuring compliance. DataScope's Asset Inspection System utilises our intuitive web-interface enabling contractors and subcontractors to easily manage the inspection routine of their equipment on site.

Subcontractors can add and edit current assets on site and manage and check what equipment is due for inspection. Inspection details can be recorded onto the system with the option to upload a certificate if required. At the same time, the main contractor can view the entire inspection regime for the site and will receive an instant email notification when assets have missed their inspection.

Users also have the ability to view and print a range of reports on inspections due, failed inspections, missed inspections and more.
