Images, video, live TV, scrolling texts and more
- **Easy to use**  
Update message areas in seconds via a drag and drop system
- **Multi-user admin**  
Authorised staff members can control their own zone of the screen if required
- **Schedule Messages**

DataScope recognises the numerous challenges associated with communicating to construction workers in a high-risk, often multilingual environment. DataVision uses LCD screens to visually convey key messages and information in a really clear yet engaging way.

Designed specifically for the construction industry, DataScope builds, delivers and maintains a digital communication system for you to broadcast up-to-the-minute information to your audience. We provide you with a solution to allow global and local information to be sent to multiple screens in unlimited physical locations all over the world.

DataVision displays all standard forms of content such as posters, images, movies, web pages, live TV, PowerPoint® presentations, RSS feeds and more. Bringing together information in such a dynamic and visually-engaging way, can turn dull, unused information into attractive business-critical content, as well as re-enforcing crucial health and safety practices which can often be forgotten.

### Control and Flexibility

Show certain messages at set times, perhaps to welcome specific guests on-site or to communicate messages to staff at times when they are most likely to be passing through Reception. With nothing to install on your computer, any user given access can simply use their secure login and make the changes needed using a simple drag and drop format.
