

# datascope

- Create an unlimited number of users
- Add as many sites as required
- Multiple users can log in from one smartphone
- Create your own set of questions for operatives
- Accurate information available in real time 24/7
- Effect method of recording workers' movements and locations
- Simple access to reports

## Remote Worker Application

The Remote Worker Application is an intelligent solution to monitoring movements of workers who are scheduled to attend remote sites in various locations anywhere in the country.

Available for use on any smartphone, operatives can use the Remote Worker app to clock in and out of work sites they are assigned to. Using GPS location data, the workers' location is registered in real time along with the time they clocked in and out. The captured data is then added to the database ready for review.

Site locations can be added through our web-based system, and companies can view data on their operatives via a range of bespoke reports. Companies can add as many operatives and sites to the system as they wish.

Each operative is assigned a unique ID number which is automatically allocated to them once they are added to the database. Alternatively, multiple users can be added to one device to allow a Supervisor to capture records for a team working at the same location.
